Digital Flushpin Gauges

Penico Gauges has added to our range of gauges a revolutionary new Digital Flushpin Gauge.

What is different with this flushpin gauge is that it gives a **digital reading of the dovetail width**. The gauge is based on the standard flushpin design but we have added a digital indicator to give a **measurement of the dovetail width**. It is provided with a calibrated setting master.

The advantages of this gauge over the standard flushpin design are many. Firstly it helps the machine operator determine exactly what material there is in the dovetail whilst machining, no more estimating! The operator has more confidence in the use of the gauge, it informs him what he needs to know in the format that he needs the information in so he can adjust his machine with confidence.

The dovetail width can be recorded as a size on your manufacturing records, not just as pass to gauge. There is no need for different flushpin gauges for minor variations on the standard sizes, one gauge will do. For example the same 3 ½" blankmould flushpin gauge will measure 75.33 diameter x 8.74 & 75.33 diameter x 8.66 & any variation between. No need for two or more gauges!

We believe the **Digital Flushpin Gauge** will be of great benefit to the Mould maker or Mould repair department.

Best regards

Allan Bridge
