Penico Mould Reamers

The Penico Mould Reamers are an essential tool for the Mould repair operation. This tool changes an expensive & difficult machining operation (often involving expensive skilled staff) into a bench fitting operation.

The use of the Reamer is very simple. The Reamer is inserted into the dovetail cutout that requires re-sizing. The two halves of the Mould are then slowly closed by a clamp whilst the Reamer is rotated by your fitter. When the Mould is fully closed the Mould dovetail is cut to the correct size. The operation is this simple! No more expensive machining & no risk of the dovetail being cut oversize! Your skilled machinists can be deployed on other work.

We sell Reamers in two type of material, Carbide tipped & premium grade HSS. The Carbide tipped Reamers are essential on bronze Moulds & last longer on cast iron moulds. The HSS reamers are for use on cast iron Moulds.

The Penico Mould Reamers have been supplied to all parts of the world to many companies. They can be manufactured to any non standard size as well as the standard Emhart fittings.

If you wish to know more about Penico Mould reamers Please contact Allan Bridge at Penico Gauges.

We look forward to helping you improve your Mould repair operations.
